## What is Claimed is:

- [c1] A comparator comprising:
  - a circuit for setting a trip point of a rising edge of an input signal according to a value of an external voltage reference; and at least two transistors, in said circuit, for setting a trip point of a falling edge of said input signal according to a width-to-length ratio of said at least two transistors.
- [c2] The comparator of claim 1, wherein said comparator cycles between an analog circuit and a digital circuit.
- [c3] The comparator of claim 2, wherein in said analog circuit, one of said at least two transistors is a tail current source transistor, and wherein said input signal rises from ground toward a positive power supply voltage, wherein said rise in said input signal switches said tail current source transistor on.
- [c4] The comparator of claim 3, further comprising a plurality of transmission gates in said circuit, wherein said rise in said input signal causes said comparator to appear as a differential pair in an open loop configuration.
- [c5] The comparator of claim 2, wherein in said digital circuit, said input signal is at an input voltage greater than said external reference voltage.
- [c6] The comparator of claim 5, further comprising a plurality of transmission gates in said circuit, wherein said input signal causes said comparator to appear as an asymmetric inverting Schmitt trigger.
- [c7] The comparator of claim 1, wherein said at least two transistors comprises: a first transistor of length ( $L_x$ ) and a width of ( $W_x$ ); and a second transistor of length ( $L_y$ ) and a width of ( $W_y$ ), wherein said width-to-length ratio equals ( $W_x L_y$ )/( $W_y L_x$ ), and wherein as said input signal decreases, a switching threshold becomes dependent on said width-to-length ratio.
- [c8] The comparator of claim 7, wherein said trip point of a falling edge of an input signal decreases by decreasing said width-to-length ratio.

[ <b>c</b> 9]	The comparator of claim 7, wherein said trip point of a falling edge of an input
	signal increases by increasing said width-to-length ratio.

## [c10] A comparator comprising:

a circuit for setting a trip point of a rising edge of an input signal according to a value of an external voltage reference; and at least two transistors, in said circuit, for setting a trip point of a falling edge of the input signal according to a width-to-length ratio of said at least two transistors.

wherein said comparator cycles between an analog circuit and a digital circuit.

wherein said trip point of a falling edge of an input signal decreases by decreasing said width-to-length ratio, and wherein said trip point of a falling edge of an input signal increases by increasing said width-to-length ratio.

- [c] 1] The comparator in claim 10, wherein said at least two transistors comprises: a first transistor of length ( $L_x$ ) and a width of ( $W_x$ ); and a second transistor of length ( $L_y$ ) and a width of ( $W_y$ ), wherein said width-to-length ratio equals ( $W_x L_y$ )/( $W_y L_x$ ), and wherein as said input signal decreases, a switching threshold becomes dependent on said width-to-length ratio.
- [c12] The comparator of claim 10, wherein said analog circuit further comprises a tail current source transistor, and wherein said input signal rises from ground toward a positive power supply voltage, wherein said rise in said input signal switches said tall current source transistor on.
- [c13] The comparator of claim 12, further-comprising a plurality of transmission gates in said circuit, wherein said rise in said input signal causes said comparator to appear as a differential pair in an open loop configuration.
- [c14] The comparator of claim 10, wherein in said digital circuit, said input signal is at an input voltage greater than said external reference voltage.
- [c15] The comparator | f claim 14, further comprising a plurality of transmission

gates in said circuit, wherein said input signal causes said c mparat r to appear as an asymmetric inverting Schmitt trigger.

- [c16] A comparator for controlling a trip point of a rising and falling edge of an external input signal comprising a first portion operatively connected to a second portion, wherein said comparator cycles between an analog circuit and a digital circuit.
- [c17] The comparator of claim 16, wherein said analog circuit comprises:

an input signal source inputting an input signal;

an output signal source;

a power supply voltage source;

an external input signal source;

- a tail current source transistor operatively connected to said power supply voltage source;
- a first pair of transistors operatively connected to said tail current source transistor, said input signal source, and said external input signal source; a second pair of transistors operatively connected to said first pair of transistors; and
- a plurality of invertors operatively connected to said output signal source, said first pair of transistors, and said second pair of transistors.
- [c18] The comparator of claim 16, wherein said digital circuit comprises:

an input signal source inputting an input signal;

an output signal source;

- a power supply voltage source;
- a tail current source transistor operatively connected to said power supply voltage source and said input signal source;
- a first pair of transistors operatively connected to said tail current source transistor and said input signal source;
- a current mirror load transistor operatively connected to said input signal source and said first pair of transistors: and
- a plurality of invertors operatively connected to said output signal source, said first pair of transistors, and said current mirror load transistor.

Page 19 of 30

- [c19] The comparator of claim 17, wherein in said analog circuit, said input signal rises from ground toward a positive power supply voltage, wherein said rise in said input signal switches said tail current source transistor on.
- (c20) The comparator of claim 18, wherein in said digital circuit, said input signal is at an input voltage greater than said external reference voltage.
